What is presbyopia?

As people age, many begin to notice that close-up objects start to appear blurry. This is a sign of presbyopia, a natural yet frustrating condition that affects most people as they enter their forties. All too often, people struggle with poor vision or settle for reading glasses while 90% of 40- to 65-year-olds wish their vision was the same as before presbyopia.¹

Now there's a contact lens available in Australia and New Zealand that is changing that issue. CooperVision® MyDay® daily disposable multifocal contact lenses provide the ideal combination of clear vision at all distances, comfort, and a healthy wearing experience.

With MyDay® multifocal, people with presbyopia no longer have to settle for glasses. You can now experience the premium performance of an advanced material and precision optical design to enjoy the freedom of contact lenses, even as your eyes change.

CooperVision® research found that 93% of MyDay® multifocal wearers felt more attractive/younger compared to when they wore reading glasses when socialising with friends. Another 88% agreed that these newly available lenses made them feel confident when performing their daily activities.²

Fitting and Trial

If you are interested, we can organise a contact lens fitting and **obligation-free trial***. If you try them and you don't like them then you simply go back to wearing your glasses as usual, but you may well find you love them. A lot of people do.
